DETAILED ACTION

Response to Arguments

1. This office action is in response to applicant's response filed on 06/12/2009.
2. Claims 25-26 is cancelled.
3. Claims 1-24 and 27-28 have been considered.
4. Applicant's arguments are persuasive in the light of Applicant Amendment filed on 06/12/2009. Therefore the rejections of claims have been withdrawn.

Allowable Subject Matter

1. Claims 1-24 and 27-28 are allowed.
2. Independent claims 1, 13, 24 and 27 are the inclusion of the following limitations that are not found in the prior art and they are uniquely distinct features. The closest prior arts are Bacon et al., Pub. No.: 2002/0101991 A1 and Min, Patent No.: 7,088,732 B2.

Bacon discloses a system with a plurality of packetized data streams, a method of designating a source of at least one packetized data stream within a multiplexed signal including at least a portion of the at least one packetized data stream, the method comprising the steps of: assigning a unique designator to the source of the at least one packetized data stream; multiplexing at least the

Art Unit: 2434

portion of the at least one packetized data stream with at least a portion of a second packetized data stream to create the multiplexed signal; and transmitting the unique designator in conjunction with the multiplexed signal, wherein transmission of the unique designator indicates the source of the portion of the multiplexed signal as the source of the at least one packetized data stream. And Min discloses an apparatus for storing and comparing PIDs comprising: at least two PID stores for separately storing first and second portions of possible PIDs, each of the first and second portions including at least two bits; a plurality of PID receiving and storing units to store at least first and second portions of a current PID of a current received packet; a first comparing unit to compare the first portion of the current PID with the first portion of the possible PIDs stored in the plurality of PID stores; a second comparing unit to compare the second portion of the current PID with the second portion of the possible PIDs stored in the plurality of PID stores; and a control unit for generating a match signal if the first portion of the current PID matches the first portion of one of the possible PIDs and the second portion of the current PID matches the second portion of one of the possible PIDs.

However, these arts, fail to anticipate or render the following limitation:

“receiving at least two data streams, each of the at least two data streams comprising a plurality of packets and each packet having a header including a packet identifier;

Art Unit: 2434

generating a multiplexed data stream in a routing component, the multiplexed data stream comprising packets from the at least two data streams arranged in an alternating order;

descrambling the multiplexed data stream using a single descrambling component distinct from the routing component, wherein the routing component sequentially routes packets from the multiplexed data stream to the single descrambling component in the alternating order;

receiving, in the routing component, packets from the single descrambling component, the packets being received in a descrambled form and in accordance with the alternating order so that a descrambled multiplexed data stream is formulated; and

outputting separate descrambled data streams from the routing component, the separate descrambled data streams being formed by demultiplexing the descrambled multiplexed data stream in the routing component” as claimed.
